# VIN ET TERRE

## Grés Sandstone Jars

Vin et Terre was founded by **Patrick Lalanne** in Bordeaux France and produces different styles of "jarres" or jars made of "grés" or sandstone for the fermentation and aging of wines. For over forty years Patrick has supplied the French wine industry with winemaking materials and has always been impressed by the results of ceramic vessels for aging wine. With contacts in the ceramic industry, Patrick decided to design and patent his own product range of **grés jarres** for winemaking purposes.

### MATERIAL

Vin et Terre crafts their jarres exclusively from grés, which contains a high concentration of **SiO<sub>2</sub>**, found naturally in "silex," also known as quartz. Once cooked, grès is extremely durable over time.

1000L Zen in a cellar in Meursault.

Coralie and Zen in a cellar.

### HISTORY

The craftsmanship technique of these jarres was invented by Chinese **ceramic specialists** along the Yellow River in **1500 BC** and was later developed in Northern Europe.

### PRODUCTION

The jarres are **assembled by hand** via different layers of sandstone clay. The finished jarre is then cooked at over **1300 degrees Celsius** or 2372 degrees Fahrenheit. After being cooked, the jarres are extremely durable and resistant to chemical and temperature changes, and have walls about **3 cm thick**.

The jarres are made from natural materials and the smooth interior makes them easy to clean. The jarres have very strong natural thermal inertia characteristics.

### POROSITY

Once cooked, the porosity of the vessel is **less than 2.5%** (the porosity of an oak barrel is between 3% - 5%) and the average radius of the pores is 0.004 microns. This allows for a **very slow and extended micro-oxidation** process that can easily be controlled and monitored.

### WINEMAKING & STYLES OF WINE

The jarres perform best for the fermentation and élevage of **white wines** or **very delicate elegant reds** and have good thermal inertia characteristics. The different models allow for different **natural fluid dynamics** that impact the rate of the élevage of the wine.

These jarres allow the wines to express their **varietal characteristics** and **showcase their crystalline and mineral components** resulting in very **pure, linear, fresh and high tension wines** that completely respect the fruit and vineyard. Because of a reduced porosity, extended aging time is advisable.

500L Coralie and a 300L Ovo Couché.

## MOVEMENT STUDY OF WINE INSIDE Vin et Terre's Grés Jarres

\*Made by the Celsius Laboratory located next to Lyon

### THERMAL CONDUCTIVITY

Thermal conductivity is a quantity introduced to quantify the ability of a structure to conduct heat, represented by the unit  $\text{Wm}^{-1} \text{k}^{-1}$ .

Conductivity of the different main materials used for the storage of wine are:

MATERIAL	CONDUCTIVITY (WM-1 K-1)
Oak	0.16
Terra Cotta	0.83
Grès	1.30
Concrete	2-5
Stainless Steel	26

**GRÉS IS THEREFORE A MATERIAL THAT IS NOT VERY CONDUCTIVE AND CAN BE TERMED AN INSULATE**

### MOVEMENT

**The movement of a liquid is dependent on:**

- The temperature gradient acts as the energy for movement
- Gravity is the motor
- The form is the accelerator or the brake

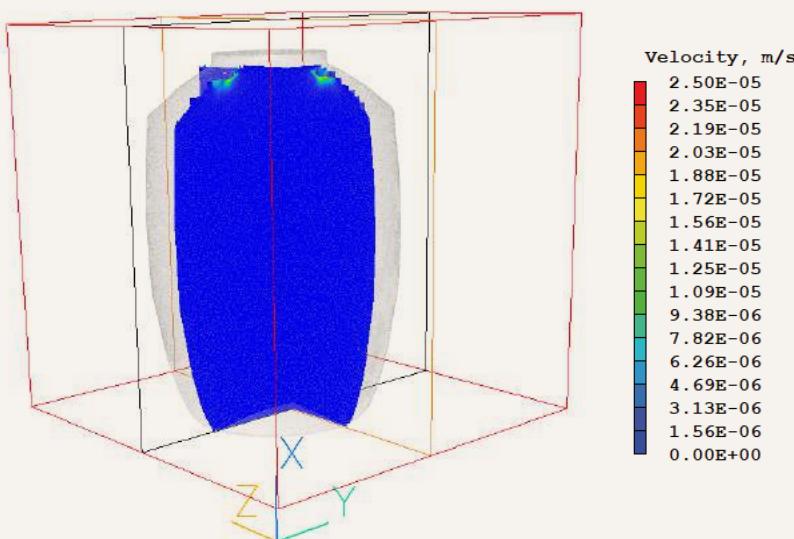

#### FORM OF JARRE

FORM OF JARRE	ZEN	CORALIE	OVO
Average Speed in cm/day inside of the jarre provoked by a thermal gradient of $3^{\circ}\text{C}$	8	43	52

For example, if we compare the movement of the wine in the form of the standing egg (Ovo) made in other materials, it would yield the following results:

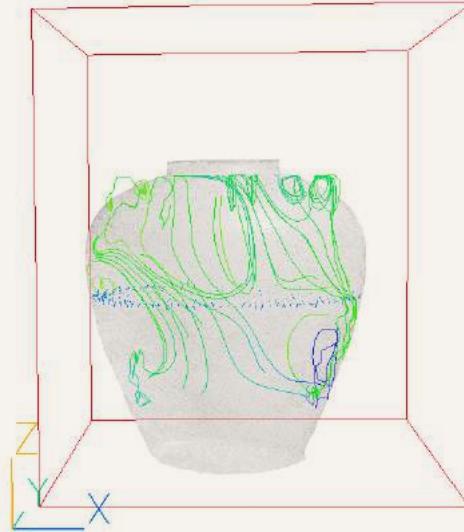

- Oak : 17 cm/day
- Concrete : 60 cm/day
- Inox : 69 cm/day

#### ZEN JARRE FLUID DYNAMICS

The shape of the Zen jarre has no curvature to give movement to the wine allowing the wine to rest peacefully with very little movement

#### CORALIE JARRE FLUID DYNAMICS

The shape of the Coralie jarre allows the wine to be tranquil with some very weak movement which allows for the enological quality of a slow exchange of tannin in the wine.

## DRUNK TURTLE

### Cocciopesto and Cement

Opus 10HL in Marlborough.

Drunk Turtle is a family-owned company located in Tuscany that has rediscovered the use of **Cocciopesto for winemaking (fermentation and aging) in the form of Cocciopesto eggs that they call Opus**. They are best known for their Cocciopesto eggs because of the material's advantages and lower CO<sub>2</sub> production footprint as compared to cement.

#### MATERIAL

Cocciopesto is a very durable ancient Roman building material that is crafted from a mix of Italian stone, sand, marl stone and terracotta that is all brought together with a natural binding agent that is extremely low in heavy metal content. In fact, it is so low in heavy metal content that alimentary goods can be put in direct contact with it. The material is also less basic than cement, therefore only a very light tartaric acid neutralization treatment is needed before usage.

Opus 10 ready to fill.

#### HISTORY

Cocciopesto was used by the **ancient Romans as a building material** for the transportation of water around the Roman empire by aqueducts and viaducts. But the **material was also crafted into wine transportation vessels**. Through recent discoveries and comparative experiments with Drunk Turtle's cement eggs, Drunk Turtle primarily crafts their eggs in cocciopesto as opposed to cement.

#### PRODUCTION

The cocciopesto is mixed and then **poured by hand into molds** and then left to air dry over a couple months. The moulds contain two pieces that are then assembled and jointed together with the **vessels' wall being around 8 cm thick**. Once dry, the eggs need to be treated with a **light tartaric acid solution** to neutralize the basic limestone content in the cocciopesto so as to not increase the pH of the wine.

Line up of Opus.

#### POROSITY

The porosity of **untreated cocciopesto varies between 2% - 5%**. However, once a thin layer of tartaric acid is applied, the porosity of the opus changes. The porosity of the Opus (along with other vessels) decreases over time.

#### WINEMAKING & STYLES OF WINE

Cocciopesto **contains bits of Impruneta terracotta inside the mix** and therefore the eggs show **thermal inertia characteristics** in terms of fermentation qualities. Meaning, the vessels will **lengthen the ferment over time** without any temperature spikes, thus **adding complexity and more fruit-driven notes to the ferment**.

The egg's practical external hatch doors make emptying them very easy. Because the vessels have a lower porosity than terracotta, they **cater to brighter, higher tension and more elegant reds and whites**. The natural egg shape keeps the lees in constant suspension, heightening the wine's **textural qualities**.

EXTERNAL COLOUR CUSTOMIZATION *Please Enquire*	-

- Safety ladder brackets, thermometer, internal cooling plates and custom exterior decoration available upon request.
- No metal rebar or netting used in structure and mixture.
- Can be used for fermentation, aging, or both.

# ARTENOVA

## Impruneta Terracotta Amphorae

ARTENOVA

TERRECOTTE • Impruneta

Leonardo Parisi (left) from Artenova with some 700L eggs.

### HISTORY

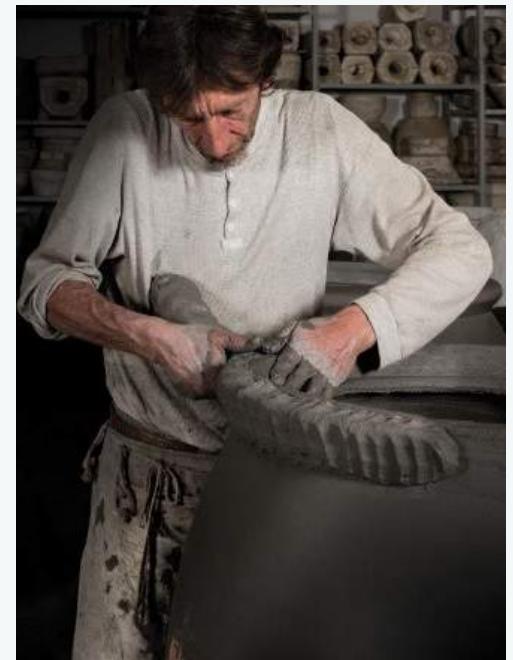

Terracotta, which translates to “baked earth,” remains the oldest ceramic that man has created, with traces of it appearing **6000 years BC**. It was later discovered in Tuscany and Impruneta by the Etruscans around 700 years BC. While terra cotta can be found everywhere, the **uniqueness of Impruneta terracotta** is its **high levels of galestro, crucial for making wine amphora**.

### PRODUCTION

The amphorae are **handmade** either via the traditional **“colombino” technique**, where the clay is hand rolled and built **30 cm high per day**, or using a method where the clay is placed in moulds. Before being cooked, the amphorae need to undergo a **7 week air drying process** where they will lose **10 - 15% of their weight due to water evaporation**. The amphorae are then cooked in large ovens that reach 1020 degrees Celsius or **1868 degrees Fahrenheit**.

### MATERIAL

Impruneta terracotta is famous because of its **mineralogical composition that is low in metals**, with the most sought after representations coming from around Tuscany's Impruneta area. Here the clay has **high levels of a calcareous residual called “galestro,” which makes it a natural heat sink**.

Colombino technique being applied to make a classic amphora.

Classic 500L “jar” amphorae lined in a cellar.

### POROSITY

Once cooked, the porosity is between **6-12%**, sometimes even a little bit more depending on the amphora's production.

The average radius of the **pores are between 0.4 to 1.1 microns**.

### WINEMAKING & STYLES OF WINE

Montecchio Impruneta terracotta works very well for the **fermentation of reds** because they naturally draw the fermentation out **without any stalling or temperature spikes**. **The vessels have very practical external doors for emptying**.

For aging, they work best on bold, tannic and reductive reds because of the increased micro-oxidation qualities. **Due to their increased porosity and permeability, shorter aging times are advised**.
